Table: Air Pollution (Annual conc	entration of human-made	fine particulate matter at an area	level Mean - µg/m3, 2016
	Kingston	London	England
Annual concentration of human- made fine particulate matter at an area level Mean	10.8	11.4	9.3

Source: Public Health England, 2018

Table: Fraction of all-cause adult mortality (persons aged 30 years and above) attributable to anthropogenic particulate air pollution (measured as fine particulate matter, PM2.5) in Kingston, London and England, 2010 to 2015

Period	Kingston	London	England
2011	6.7	7.2	5.4
2012	6.1	6.6	5.1
2013	6.2	6.7	5.3
2014	5.9	6.5	5.1
2015	5.1	5.6	4.7
2016	6.1	6.4	5.3

Note:  $PM_{2.5}$  means the mass (in micrograms) per cubic metre of air of individual particles with an aerodynamic diameter generally less than 2.5 micrometers.  $PM_{2.5}$  is also known as fine particulate matter Note, attributable deaths statistic is an estimate of the overall health effect of air pollution on the population of an area. It is derived from the rise in risk of death associated with a standard level of pollution, then converted to an equivalent number of deaths based on population and pollution levels to help describe the scale of this risk.

Kingston London England					
2015	13.8% to 16.9	(10.8 )	15.2%	(14.6 to 15.7)	15.5% (15.3 to 15.7)

Note: Values in brackets denote 95% confidence intervals

In 2013, several survey modules were removed from the Integrated Household Survey (HIS) to leave a dataset solely based upon the Annual Population Survey (APS). Some differences in survey coverage, imputation and weighting methodology may have resulted in some discontinuity for certain 'core' variables compared to estimates previously provides as part of the IHS, therefore the HIS and APS should not be directly compared.
